

uManage®

Work Order Management

uManage®

uManage® is designed to work seamlessly with our utility billing solution. It allows the user to create, manage and close out work orders that are related to utility billing accounts for tracking purposes. It also has its own location database for any service location that does not have a billing service connection. Office and field personnel can create a work order directly from a billing customer's record or from a defined service location.

Inventory

Track material availability at any time in a utility billing region and/or company wide basis. Set reminders for reordering purposes.

Recurring Work order

Set up auto-generated work orders on a user defined recurrence for specific locations and work order types.

Billing/Invoicing

Create invoices and include all of the work performed within the client's region with the District's contractual rates.

Work Order Management Solutions

Implementation

AVR, Inc. will help you configure listings of departmental/work order types, materials, equipment, personnel and vendors. As well as their contractually billed, cost amounts and enter those codes into the database. This process is essential in its design to produce effective and accurate reporting.
